

## Structurterm Roofline System

Structurterm's Roofline™ system is a modular Aluminium Integrated rainwater management system, designed specifically for External Wall Insulation (EWI) systems to provide a simple yet robust extension to eaves and verges that negates the need for costly adaptations to roofs.

- Designed so that rainwater flows and discharges to the front of the gutter and outside of the EWI system.
- Sits high up to the underside of the tiles and used where the existing roof / tiles have insufficient overhang
- Mounted onto A1 fire rated Insulated fascia board to prevent cold bridging and condensation associated with trims and profiles
- Assessed by the BRE and proven to thermally improve the junction between roof and EWI system
- Double Sealed to prevent water ingress at the head of the EWI System
- Aesthetically pleasing with traditional style profiles
- Cost effective and faster alternative than roof extensions
- Complies with the revised PAS 2035 Weathering Guide Principles
